

Did you know?

A windshield repair is only as good as its resin.

Injecting resin is one of the basic steps of windshield repair. Designed to fill the break and bond the glass, resin is the key to restoring the structural integrity of the windshield. But without mandatory testing requirements, many resin brands fall short. **Why should you care?**

SAFETY

FACT: In a front-end collision, the windshield provides up to **45% of the structural integrity** of the vehicle's cabin. Rollover? Make that 60%.

When a windshield is repaired with poor resin, the structural integrity of the glass is weakened, potentially compromising the safety of the car's occupants.

GlasWeld's resin tested an average of **34% stronger** than other leading resin brands.

STRONGER

APPEARANCE

Bad Resin = Ugly Repairs

A solid windshield repair should be barely noticeable (and stay that way). Many resin manufacturers consider it normal for their resin to yellow, chalk, and crack with exposure and time.

GlasWeld resin is **GUARANTEED** to withstand even the harshest environments.

Our company is proud to use GlasWeld resin, the strongest, best-performing resin in the industry.
